The Cold Call Script Blueprint: Founder Edition

Step 1: The Authority Intro (0–10 seconds)

The Goal: Establish your identity cleanly without sounding like a standard sales rep. **Delivery Tip:** Speak slowly and naturally. Avoid overly enthusiastic sales greetings.

"Hi [Name], this is [Your Name]. I'm the founder of Orcanos. I know you weren't expecting my call—do you have a brief moment?"

[Wait for acknowledgment]

Step 2: The Core Value Proposition & Orientation (10–20 seconds)

The Goal: Give the prospect immediate context so they understand exactly who you are and what your company does.

"Thank you. I'm personally leading our enterprise expansion here in the US, reaching out to QA leaders because **we provide a single, unified software platform that connects your QMS directly with your design controls and manufacturing processes.** I'm calling a select group of executives in the region to get a pulse on how teams are balancing their compliance footprint with their daily engineering output."

Step 3: The Diagnostic Leading Question (20–40 seconds)

The Goal: Turn the pitch into a peer-to-peer consultation and gather immediate intelligence on their setup.

"Quick question for you: **What are you currently running for your eQMS setup?**"

[CRITICAL PAUSE: Stop talking completely. Let them answer and take notes on the system they name or if they say they use manual processes.]

Step 4: The Macro-Pain Frame (Choose Path A or Path B based on their answer)

PATH A: If They Name a System (e.g., TrackWise, Arena, Greenlight, MasterControl)

The Pivot: Validate their system choice, then immediately highlight **The Isolation Trap** and **The Customization Tax**.

"Perfect. That's a very common platform, and it handles basic compliance well. But the reason we built Orcanos is to address two massive headaches I see across the medical device space: **the isolation trap and the customization tax.**

First, traditional eQMS systems sit in a silo. They handle basic documents, some quality processes, but they don't touch actual engineering, design controls, or manufacturing. Teams spend a fortune on them, but engineers are *still* stuck using Excel for BOM tracking, SharePoint for DHFiles, and separate tools for training, complaints, assets. So highly paid quality engineers waste hours acting as manual data cables between systems.

Second, your processes constantly evolve. With legacy systems, every time you update an SOP, you have to pay thousands of dollars for slow, expensive external customizations just to tweak a simple form or workflow.

[Slight pause—drop your pitch energy and ask casually:]

Does that customization tax or system-switching ring a bell with your current setup, or are they letting you make those changes internally?"

[DELIBERATE PAUSE: Wait for acknowledgment. Let them vent about their current vendor or explain their internal setup.]

[Once they answer, transition back naturally:]

"Exactly. And that's exactly why we handle this entirely differently. Orcanos unifies quality, design, and manufacturing into one place, allowing you to completely configure your own forms and workflows natively according to your exact SOPs—meaning you can completely retire those 3 to 4 fragmented legacy systems and stop paying for customizations.

Path B: If They Say "We don't have one / We use paper, Excel, and SharePoint"

"Honestly? That is actually great news, and you are in a much stronger strategic position than you think.

Usually, growing medical device firms think the next step is to buy a standard, legacy eQMS. And while those systems can handle standard document control and quality processes, they leave your QA and RA engineers completely stranded when it comes to the actual product development side. They don't touch your design controls. You buy one, and your team is *still* stuck manually managing system requirements, complex traceability matrices, risk management, and V&V inside disconnected Excel spreadsheets and SharePoint folders.

On top of that, as your startup grows and your processes change, those systems lock you in. Every time you need to tweak a workflow to fit a new SOP, legacy vendors hit you with massive, expensive customization fees.

[Slight pause—drop your pitch energy and ask casually:]

Does that administrative headache of your engineering team managing requirements in Word, risk in Excel, and files in SharePoint ring a bell, or are you trying to find a way to automate all of that under one roof from the start?"

[DELIBERATE PAUSE: Wait for acknowledgment. Let them explain their current scaling or engineering pains.]

[Once they answer, transition back naturally:]

"Exactly. And because you haven't locked yourself into a rigid, legacy vendor yet, you can completely bypass that nightmare.

Instead of buying 3 or 4 separate systems down the road or paying consultants for every workflow tweak, you deploy Orcanos as a complete, unified platform built specifically for QA and RA engineers. It automates your entire design control lifecycle—managing your requirements, live traceability, risk, and V&V side-by-side with your standard quality processes. Plus, it is completely flexible, allowing you to configure your own forms and workflows natively as your SOPs evolve.

Step 5: The Consultative Pause (The Permission Gate)

The Goal: Break up the monologue, shift the power dynamic, and get active psychological buy-in. **Delivery Tip:** Lower your voice slightly, slow down, and sound casual.

"Do you mind if I share a quick, real-world story of how a peer company handled this exact transition?"

[DELIBERATE PAUSE: Wait for them to say "Sure," "Go ahead," or "Yes."]

Step 6: The Proof (The Micro-Case Study)

The Goal: Use heavy, aggressive volume metrics and ROI data to prove enterprise-level credibility.

"We recently deployed our unified architecture for Covaris, a complex medical device division under PerkinElmer. To give you an idea of scale, they manage a massive operation: **over 500 sellable products, 8,000 active parts, and more than 10,000 controlled documents**. They were heavily fragmented—running 3 to 4 disconnected legacy systems, and their previous eQMS was meeting only 22% of their actual operational needs. It was so bad they were processing over 5,000 manual training events a year just to keep up with minor document changes.

By migrating their entire ecosystem into our flexible platform, **we completely eliminated four full-time positions' worth of pure administrative paperwork waste**. Their leadership reallocated those 4 FTEs straight back into actual quality engineering and product innovation. Because everything was unified, they recently passed four consecutive FDA audits in a ten-day window with *zero* back-room preparation or scrambling—the auditors just viewed the live system."

Step 7: The Final Soft Hook (The Close)

The Goal: Secure a peer-to-peer executive briefing, not a sales demo.

[If Path A:] "I'm curious—even with your current eQMS setup, are your quality engineers still losing hours managing data across separate spreadsheets and folders to bridge those design and manufacturing gaps?"

[If Path B:] "Since you are looking at how to scale your infrastructure right now without drowning in manual paperwork, I'd love to personally share the technical blueprint of how we structured that transition."

[The Call to Action for both:] "Let's grab a brief, 15-minute introductory conversation next week leader-to-leader, just to put this architecture on your radar. How does your calendar look next Tuesday or Thursday?"

Step 8: Master Resistance Handling Toolkit (Founder Persona)

Resistance 1: "We are in the middle of a major project / too busy right now."

"I completely respect that. If a QA leader told me they weren't buried in a project, I'd be shocked. But let me challenge that for a second: the very reason your engineering team is so busy is likely because they are stuck maintaining 3 or 4 disconnected systems. When we took Covaris over to a single platform, we permanently cut out 4 full-time positions' worth of pure data-entry noise. I'm not asking for a major software project kickoff today. Let's protect your time—I can send over a brief 90-second screen recording showing how they manage 8,000 parts and 10,000 documents natively in one view. Review it whenever you get a breather. Fair enough?"

Resistance 2: "We already spent a lot of money and time on our current system."

"I expect nothing less; you have to have a system in place. But what I usually find is that companies have a QMS for compliance, but they are still using separate tools or spreadsheets for PLM, BOM tracking, and training. They are paying multiple

software subscriptions, and their engineers are stuck acting as the manual bridge between them. We aren't looking to just add another tool; we look to replace those 3 or 4 fragmented systems into one single platform. Is your current system handling 100% of your product lifecycle from requirements and design to parts, or is your team still bridging those engineering gaps manually with Excel?"

Resistance 3: "We don't have the budget for a new platform right now."

"I completely understand—every corporate dollar is being tightly scrutinized right now. But as a founder, let me give you the operational math: this isn't a cost center, it's an immediate cost-saving play. When we consolidated those systems for Covaris, it was a highly efficient \$25K setup that immediately stopped them from having to hire 5 new people, saving them \$455K in overhead. It instantly clawed back 4 FTEs' worth of wasted time. I'm not trying to sell you something for this quarter's budget. Let's just spend 15 minutes looking at the architecture so you have the benchmark numbers for your next fiscal planning cycle. Would next Tuesday work?"

Here is a complete, step-by-step structural blueprint for your new cold call script. Because you are the **Founder**, this structure is designed to completely bypass the standard "salesperson" vibe and position you immediately as a high-level strategic consultant.

Review this breakdown of the steps, the psychological order, the data points, and the deliberate pauses before we write out the final text.

The Cold Call Blueprint & Structure

Step 1: The Authority Intro (0–10 seconds)

- **The Goal:** State who you are cleanly without sounding like an SDR.
- **The Rule:** Do *not* ask "How are you today?" or "Is this a good time?" Instead, use a brief acknowledgment that you are interrupting their day, which commands respect.
- **The Action:** State your name, your title (Founder), the company name, and ask for a quick moment.

"Hi [Name], this is [Your Name], co-founder of Orcanos. I know you weren't expecting my call, do you have a brief moment?"

[Wait for acknowledgment]

Step 2: The Core Value Proposition & Orientation (10–20 seconds)

- **The Goal:** Give them immediate orientation so they don't get confused about why a software founder is calling them.
- **The Action:** Define Orcanos in one clear sentence as a unified platform connecting QMS, Design Controls, and Manufacturing.

"Thank you. I'm personally leading our expansion here in the US, reaching out to QA leaders because **we provide a single, unified platform that connects your QMS directly with your product and engineering requirements**. I'm reaching out to get a pulse on how teams in the region are balancing their compliance.

Step 3: The Diagnostic Leading Question (20–40 seconds)

- **The Goal:** Gather immediate intelligence and turn the call into a two-way diagnostic consultation.
- **The Action:** Ask: *"What are you currently running for your eQMS setup?"* * **The Pause:** Stop talking completely. Let them answer.

Quick question for you: **What are you currently running for your eQMS setup?"**

Step 4: The Macro-Pain Frame (The "Pivots")

Depending on their answer from Step 3, you choose one of two strategic directions:

- **Path A (If they have a system):** Target **The Isolation Trap** (system-switching between Excel/SharePoint for design/manufacturing) and **The Customization Tax** (paying expensive consultant fees every time a process or SOP changes).
- **Path B (If they are on paper/Excel):** Reassure them they are in a great position to bypass the "fragmentation phase" entirely. They don't need to buy 3–4 systems down the road or pay massive customization fees as they grow; they can deploy one flexible platform from the start.

Step 5: The Consultative Pause (The Permission Gate)

- **The Goal:** Break up your monologue, shift the power dynamic, and get active psychological buy-in.
- **The Action:** Lower your voice, slow down, and ask: **"Do you mind if I share a quick, real-world story of how a peer company handled this?"**
- **The Pause:** Stop completely. Wait for them to say "Sure/Go ahead."

Step 6: The Proof (The Micro-Case Study)

- **The Goal:** Use your exact volume metrics and aggressive ROI data to prove your platform handles heavy enterprise scale effortlessly.
- **The Metrics to Include:**

- **The Scale:** 500 sellable products, 8,000 active parts, 10,000 controlled documents.
- **The Legacy Failure:** Covaris (under PerkinElmer) had a system meeting only 22% of needs, forcing 5,000 manual training events a year.
- **The Aggressive ROI:** Consolidated into Orcanos, completely eliminated 4 full-time positions' worth of pure administrative waste, and passed 4 FDA audits in 10 days with zero back-room prep.

Step 7: The Final Soft Hook (The Close)

- **The Goal:** Secure a peer-to-peer executive briefing, not a sales demo.
- **The Action:** Ask a tailored curiosity question based on their path, then propose a brief 15-minute introductory alignment call for next week.

Step 8: Master Resistance Handling Toolkit (To keep handy at the bottom)

A unified section containing your founder-level responses to the top three objections:

1. *"Too busy / Middle of a project."*
2. *"We already spent money on our current system."*
3. *"We don't have the budget right now."*
